CASO PRÁCTICO 1:

<u>Descripción de la Pregunta</u>

1. Creamos el proyecto y la estructura de carpetas:

2. Creamos la clase SueldoDonofrio

Pregunta 2: Aperturando la terminal

3. Crear el método toString:

4. Trabajando en el método principal:

```
package plcc.casos.Main;
6 - import plcc.casos.Clases.SueldoDonofrio;
7 - /**
     * @author pedro
*/
10
     public class DonofrioMain {
11
12
13 🖃
14
         * @param args the command line arguments
15
16
        public static void main(String[] args) {
           SueldoDonofrio sueldoOperario = new SueldoDonofrio ("15474712", "Pedro Carbonero", 2300);
17
18
            System.out.println(sueldoOperario.imprimirDatos());
19
            // Metodo set:
20
21
            sueldoOperario.setDni("08141475");
22
            sueldoOperario.setNombreOperario("Jesus");
23
            sueldoOperario.setSueldo(5000);
            System.out.println("-----
24
25
            System.out.println(sueldoOperario.imprimirDatos());
26
27
            // Metodo get
28
29
            System.out.println("---
30
            System.out.println(sueldoOperario.getDni());
